Eclypsium Frontend technical challenge - Sr Software engineer

Challenge Objective

Design and develop a visual application to manage **assets** and their **components**, which may include vulnerabilities and threats identified through scanning processes (Note that we consider that the asset has a vulnerability or threat if the latest scan indicates that).

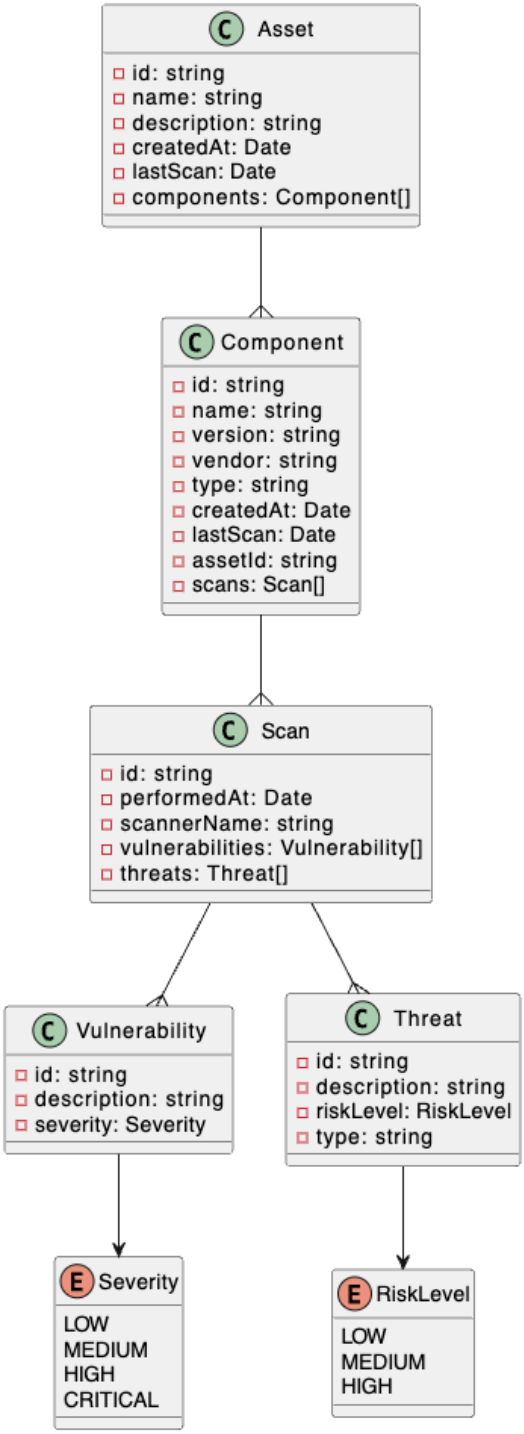
The solution must support the following features:

1. **Asset Listing**
    - Display registered assets with the ability to filter by relevant criteria.

Expected Deliverables

- A functional FE solution that meets the requirements described above. We suggest a solution that uses the suggested backend service and a UI to interact with the features.
- Flexibility in implementation to allow deployment in an operational environment.
- Clear instructions for configuring, running, and testing the solution.

Backend Model



Notes:

- Suggested languages: TS and React, but you can pick any other stack of your preference.

Evaluation Criteria

The evaluation will consider:

- The clarity and effectiveness of the proposed solution.
- The organization and presentation of the submitted work.

Submission

Upload the complete project to a public or private repository that can be accessed for review. Include a document with clear instructions for evaluating the solution.

Good luck with the challenge! 🚀
